

Conclusion

This product can be improved upon by implementing a new class that implements file writer and uses the sorted tree collection as a buffer to store values temporarily and sort file already written. I feel the main selling point for this program is simple. You have a program that can not only store files, but it can store information about the file with it. This extra field can be used to expand upon its deployment. This extra field can be used to store a memory address to allow implementation into an operating system.

Or, you use it without the users knowledge to gain information from the user to use for future sales purposes. The possibilities are only as limited and you make them to be.
